

Sustainability Project Management Process

Among the areas of expertise that we bring to our projects are:

- The incorporation of Environmental, Social and Governance (ESG) targets and reporting requirements
- Alignment with EU Taxonomy compliance, green procurement and responsible sourcing
- Alignment with sustainability accreditations that have been achieved on many of our projects including HPI, BREEAM, LEED and WELL among others
- Consideration of impacts to and best solutions for each individual project including design, cost, programme, procurement, construction, maintenance and operations

Lafferty have created a clear project management process for successfully achieving sustainability goals across all of our projects including encouraging our clients to review sustainability options and benefits at early project stages.
